

Projekt-Backup erstellen

Prepare a backup of your projects at regular intervals to avoid data loss. Also prepare a backup of your projects before an upgrade to a higher GridVis version.

To prepare a backup of a GridVis project with JanDB, proceed as follows:

1. Close GridVis Desktop and GridVis Service.
2. Copy the project folder.
(The storage location of the project folder can be found in the GridVis overview window. Fig. 1)
3. Keep the copy safe.

A backup for projects with an SQL database is created by preparing a backup of the connected SQL database. Contact your system administrator for this.

The [project backup](#) and [project export](#) functions are available as of GridVis version 7.3.60.
